

ABSTRACT

An apparatus is disclosed comprising a base and a container. The container typically includes a top portion and a bottom portion, wherein the top portion is hinged to the bottom portion. The container is fixed to the base so that the top portion can be rotated upwards to reveal a cavity in the container for storing objects. The container may include a lock which can be locked to prevent the cavity from being exposed. The base may have an open box structure with a chamber in which the container is placed.
